Description:

With an ever increasing worldwide population along with the ubiquity of plastics in our society, researchers and scientists are beginning to share their findings on how plastics are making their way into our marine and terrestrial environments. As plastics break down, irreversible consequences are affecting our food sources and the world we live in. In this project, we search for insights that help us better understand our use of plastic, single-use plastics, and how we are affecting the world in which we live.

Tools used in the Project
